

①

Simple page tables

Frame = block for below

- ① start with main size (128 rows or 7 bits)
- ② decide block size below we have 8 blocks
- ③ 4 bits to address each block $\log_2(\text{block-size}) = 3 \text{ bits}$
for left we need $\log_2 16 = 4 \text{ bits}$
4 bits to get to every cell in a block

0	05
16	X
32	
64	3
	0
	X
	2
	X
128	1

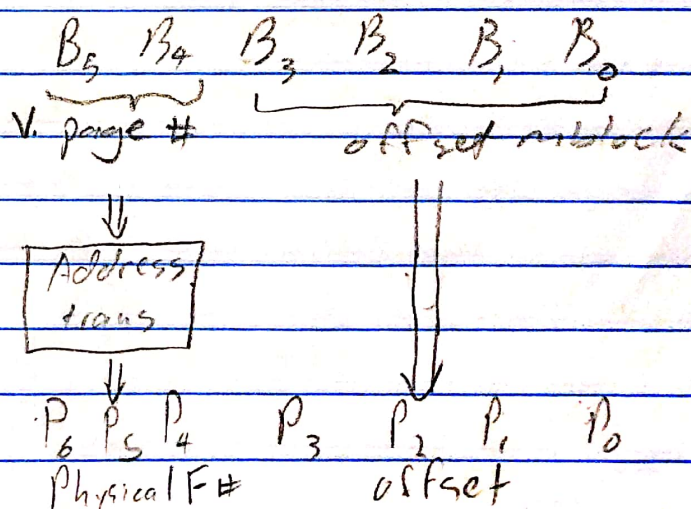

④ Now how about your process?

say, it takes 4 blocks

⑤ each block is 16 bytes long

Page #	0
	16
1	32
2	48
3	64

bits to address it all = $\log_2 64 = 6$

Page table

index	VP	PF
0	3	
1	7	
2	5	
3	2	

\Rightarrow

00	011
01	111
10	101
11	010

say we have `mov 21 %eax` load `%eax` from 21

21 \Rightarrow bin \Rightarrow 010101

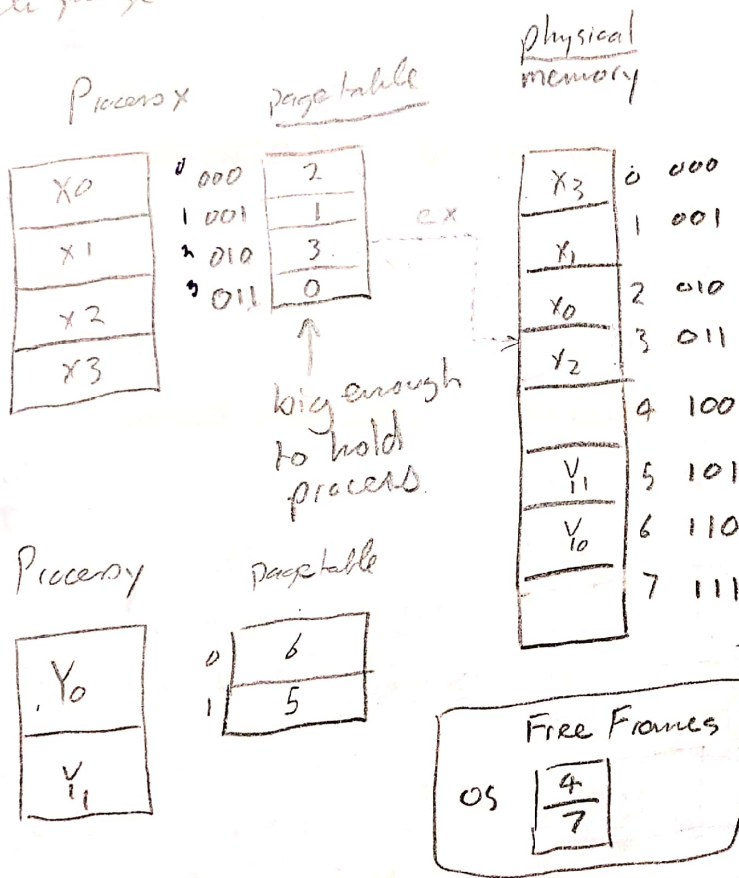

111 0101 \leftarrow physical address

paging

64 bits 64 frames 26 frames each with 2¹¹ words

each page table kept with process control block

say have 8 bit address space

have 8 frames (36 bits)
frames have 2⁵ = 32 words

but still need all of process in mem at once!
also internal frag on last block of process.

ex 8 bit logical address for process X

logical

010 00001 ⇒ 011 00001

page # offset

see above page table

ex. 5 bits $2 \rightarrow$ VP# 3 offset
 $2^2 = 4$ blocks $2^3 = 8$ rows block

	00
B ₁	01
A ₀	10
B ₀	11

Free blocks
 0, 1, 2, 3

what if A had 3 blocks? Next chapter, virtual

have a system virtual address is

100	1111
-----	------

 physical address is

10	1111
----	------

what can we tell me?

at least 2 VP bits, if know block size, know all

OK block size = 4 bits

have $2^2 = 4$ blocks

each $2^4 = 16$ bytes long

	00
	01
	10
	11

physical addresses here
 program has at least 1 block
 (because virtual is 00)
what if 101111? then prog
 has at least 3 blocks
 so 2 other blocks occupied

block size = 3 bits

have $2^3 = 8$ blocks

each block $2^3 = 8$ bytes

long

	000
	001
	010
	011
	100
	101
	110
	111

know our prog has
 at least 2 blocks
 (VP# \rightarrow 000 + 001)

what if you have this

	PT	Phys Mem (frames)	Free block list
A	<div style="border: 1px solid black; display: inline-block; padding: 2px;">A₀</div> <div style="border: 1px solid black; display: inline-block; padding: 2px;">A₁</div>	<div style="border: 1px solid black; width: 50px; height: 20px;"></div> <div style="border: 1px solid black; width: 50px; height: 20px;"></div> <div style="border: 1px solid black; width: 50px; height: 20px;"></div> <div style="border: 1px solid black; width: 50px; height: 20px;"></div>	?
B	<div style="border: 1px solid black; display: inline-block; padding: 2px;">B₀</div>		

for 6 bits

	virtual address	Physical Address
A	01 1111	00 1111
A	00 1111	11 1111
B	00 1111	10 1111

show where process pages are in physical mem. ← phys mem has 4 frames ⇒ 2 bits each frame
 24 = 16 bits
 show PT for each process
 show free block list
 determine block size (#page bits) + #address bits

	PT		Free
A	<div style="border: 1px solid black; display: inline-block; padding: 2px;">A₀</div> 0 11 <div style="border: 1px solid black; display: inline-block; padding: 2px;">A₁</div> 1 00	<div style="border: 1px solid black; display: inline-block; padding: 2px;">A₀</div> 00 <div style="border: 1px solid black; display: inline-block; padding: 2px;">X</div> 01 <div style="border: 1px solid black; display: inline-block; padding: 2px;">B₀</div> 10 <div style="border: 1px solid black; display: inline-block; padding: 2px;">A₀</div> 11	<div style="border: 1px solid black; display: inline-block; padding: 2px;">1</div>
B	<div style="border: 1px solid black; display: inline-block; padding: 2px;">B₀</div> 0 10
